

Shipwrecks can mirror predator assemblages of pelagic pinnacles but may lack the trophic balance of natural reefs

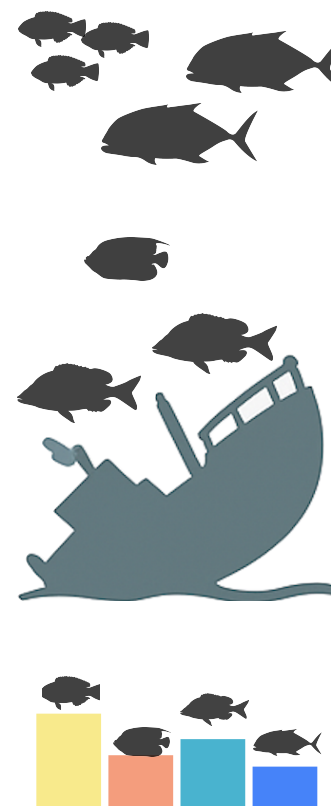

Fringing Reefs

Pinnacles

Shipwrecks

350 surveys | 162,894 fish | 14 sites
bayesian multivariate models

Wrecks ≈ Pinnacles

↑ High trophic level predators

Wrecks ≠ Natural Reefs

↓ Grazers, Invertivores

Why?

Less benthic complexity, fewer resources

Takeaway:

Supports fisheries

Not full ecosystem

Design ARs with specific, ecological goals + protect natural reefs
